WE MOVE YOU

DISCOVER THE LOKOMAT®!

The Lokomat® is the world leading robotic rehabilitation device that provides highly repetitive and intensive physiological training. The Lokomat® improves the therapy outcome by providing individualized training for children and parents in a highly motivating environment with augmented performance feedback and dynamic body weight support.

### Advantages of Lokomat® Therapy

- **Effective Rehabilitation Training**
  Robot-assisted therapy enables effective and intensive training to increase the strength of muscles and range of motion in order to improve walking.

- **Most Physiological Movement**
  The physiological movement of the lower extremities is ensured by the individually adjustable patient interface. Additionally, the hip and knee joint angles can be adjusted during training to the patient's specific needs.

- **Optimal Patient Challenge**
  During rehabilitation, patients need to be challenged. Therapists can help patients reach their goals by adapting the therapy with assist-as-needed support and motivating, game-like exercises according to their performance.

- **Increased Efficiency**
  The Lokomat® allows therapists to focus on their patients and their actual therapy. It enhances training efficiency and safety, leading to higher exercise intensity, and consistent, prime patient care.
